

Title

Fetch-It: An Automated Logistics Management System

Description

Fetch-It is a end-to-end mobile logistics platform designed to connect senders and commercial clients with available freight drivers and delivery fleets. Built to eliminate manual dispatching bottlenecks, the system automates vehicle matching, fare estimation, and cargo tracking in real time.

Through dedicated mobile interfaces for customers and drivers paired with a centralized administrative web panel, Fetch-It provides end-to-end transparency, verifiable package handoffs, and optimized routing for urban and regional deliveries.

Features

Instant & Scheduled Booking: Drop location pins, select cargo vehicle classes (e.g., motorcycle, closed van, flatbed), and set immediate or scheduled pickup times.

Upfront Dynamic Fare Estimator: Calculates delivery costs instantly based on distance metrics, vehicle capacity, cargo weight, and peak demand multipliers.

Real-Time GPS Package Tracking: View live driver movement along the route with dynamic Estimated Time of Arrival (ETA) updates.

Turn-by-Turn Route Optimization: Built-in map navigation that calculates optimal multi-stop paths to avoid traffic bottlenecks.

Digital Proof of Delivery (e-PoD): Captures recipient electronic signatures, OTP security validation, and time-stamped photo verification upon completion.

Automated Matching Engine: Algorithmically assigns incoming bookings to the nearest compatible driver based on proximity and vehicle load constraints.
